

# UPHORIA HACKATHON

A NEWS WEB APP

: Team Members :

Kushagra Rode

**Data Pirates**

# OUR IDEA

Our Main Idea behind this project was to make a categorised news web app which contains all the major categories of news like sports, business, etc.

We also wanted to display the corona statistics so that people are informed about the concerned statistics of the pandemic.

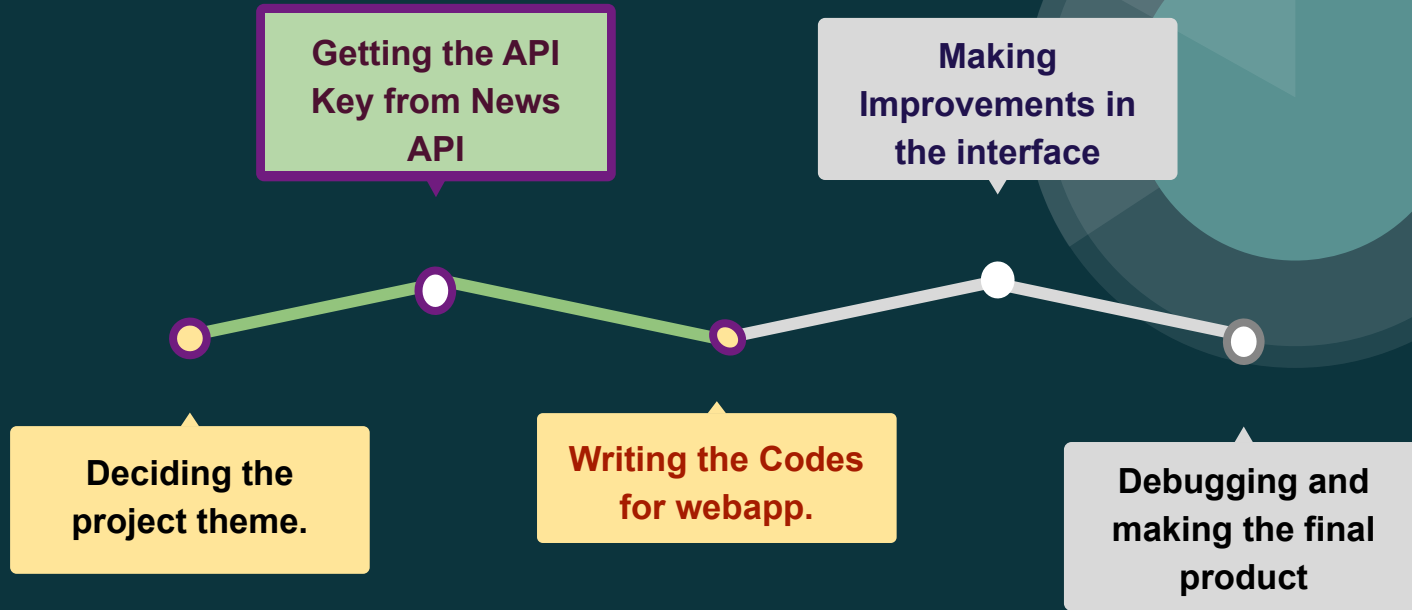

# USABILITY

Our News Web app is useful for getting the top headlines quickly and provides a small description of them. If the user wants to know more on that news he/she can click on the link given in the news description.

Also our news app contains various categories for the user to select from and read the top headlines of that particular category. ( eg Sports, Business, Technology, Science, Health)

Another major use is to get the corona statistics of any country in the world.

# TIMELINE

# **TIMELINE**

**Adding more  
categories of  
news**

**Adding a  
Personalised  
touch by taking  
the user's  
preferences.  
Adding videos,  
graphs and  
infographics of  
collected data.**

**Introducing Live  
Updates feature  
(like live Cricket,  
live Election  
Polls, live stats)**

**Taking reportings  
by users, so as to  
make information  
quick, and letting  
them monetize  
their work.  
Earnings can only  
be made after user  
is verified.**

# SCALABILITY

Our web app is quite scalable. It can be easily upgraded to contain more categories like bollywood, education etc. This would increase the reach of our web app to various other domains.

Secondly, we can add a personalised touch by asking the user the categories he/she is interested in and then accordingly providing the news items.

Also, we can include a live feed tab which would provide the live updates of various events like a cricket match or the elections.
